

Over the summer I designed a layout for a type of personal blog called “riley.SOUP”. This is not the design I want to use for my class portal, but I didn’t realize this entry was due today, so I am offering it here now as an attempt to save my grade. This design would make use of CSS breakpoints in order to switch from desktop to mobile-friendly layouts.

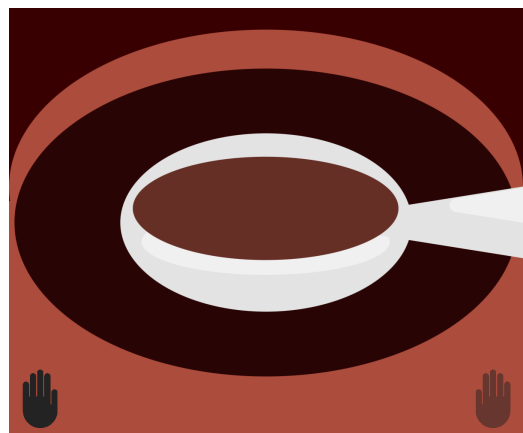

initial view as page loads

scrolling down reveals author bio

after loading the spoon slides out to reveal navigation

clicking on the hands changes which side the spoon is held from

mobile-friendly designs
